

## Methodology of work at Neurowork

### TECHNOLOGY IN YOUR HANDS

Technology in your hands. Our solutions and services facilitate the adoption of latest technologies to companies of all sizes decreasing the technology break.

#### Methodology of work at Neurowork

At Neurowork, we have the newest tools to achieve an optimal work experience with our clients:

- Our own NOC to mount the development/testing projects emulating real production systems.
- Multiple methods for communication with our clients (e-mail, Skype, MSN Messenger, GTalk, Phone, VoIP).
- Integrated incidence system with tickets based support.
- Versioning control system for documentation and source code.
- Personnel available for spare in the event of need.
- Document and project resources handling system.
- Project, tasks and goals handling system.

#### RUP Methodology

For high complexity projects which require a careful development process, at Neurowork we use the RUP Methodology (Rational Unified Process). RUP is a process of software development and together with the Unified Modeling Language UML, constitutes the most used standard methodology for analysis, implementation and documentation of object oriented systems.

#### RAD Methodology

For not so complex projects which need a faster production we have experts in Rapid application development (RAD). RAD is a software development process which includes the interactive development, the construction of prototypes and the use of CASE (Computer Aided Software Engineering) utilities. Traditionally, the fast development of applications tends to also include the usability, the utility and the execution speed.

#### XP Methodology

We also have professionals experienced in eXtreme Programming (XP). XP is the most highlighted of the agile software development processes. XP differs with the traditional methodologies mainly in putting more emphasis into adaptability than into predictability.
